

Rofin Launch New Generation EasyMark

Rofin's all new EasyMark IV builds on the strengths of its predecessors in this very successful product range, extending operational flexibility and further improving the user interface. The system incorporates a programmable z-axis as standard and can be optionally equipped with various optics (providing up to a 180x180mm marking field), external or through-the-lens camera solutions and / or a rotary axis for circumferential marking of cylindrical components.

Widely accepted as one of the most compact laser marking systems on the market, EasyMark provides access to areas of laser marking which were once seen as the

sole domain of laser specialists. Operating from a regular single-phase power socket (100 – 240VAC, 50/60Hz), the system does not require any external cooling, and has the same safety rating as a domestic CD player thanks to the fully enclosed, laser safe, marking enclosure. The self contained and compact desktop configuration of the system means that the unit is easily portable, giving the user more freedom in the choice of location and operation.

(Rofin EasyMark IV – Compact and simple to use)

EasyMark IV is available with a number of laser options, all of which are fully integrated and completely air-cooled. Lasers available include diode-pumped Nd:YVO₄ which are particularly impressive for plastic processing, or Yb Fibre lasers which are great for high speed metal engraving. Available laser powers range from 10 to 50Watts allowing the user to select the laser source best suited to their application and budget. Each of the laser variants is capable of marking a wide range of materials including bare and coated metals and most commonly used industrial plastics.
